Directed PhET since 2008

Carl Wieman

Founder and Senior Advisor

Nobel Laureate in Physics
Professor, Stanford University
Chair, NAS Board on Science Education (2004-9)
Associate Director of Science at OSTP (2010-12)

2019 PHET TEAM

15 FULL-TIME, 21 PART-TIME TEAM MEMBERS

K12 and College Education Specialists

150+ years of teaching and experience in STEM education

Sim Design Experts

100+ years of design and study of PhET sims

Software Development Team

50+ years of PhET sim development

Education Researchers in STEM learning

60+ articles on PhET sim design and learning

Content Experts/PhDs

in physics, chemistry, and math

Quality Assurance Team

of dedicated undergraduate assistants

plus **Administrative, Marketing, Graphic Design,
Fundraising team members**

CURRENT POSITION AND IMPACT

PhET simulations usage: All sims – HTML, Java, Flash
(2018 includes Nov/Dec estimates)

**Simulations:**

152 sims; 73 sims in HTML5
(79 legacy sims to move to HTML5)

License:

CC-BY

Teacher resources:

1800+ lessons; PD videos & docs

Widespread usage:

>100 million sim uses/yr

Broad user base:

K-12 and college, worldwide

Global adoption:

Sims in 93 languages
Used in 200 countries/territories

Product Integration:

20+ companies using PhET CC-BY
e.g. Pearson, STEMscopes, Nearpod

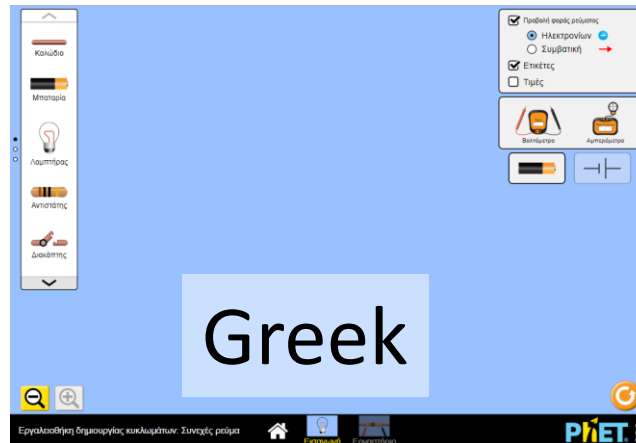

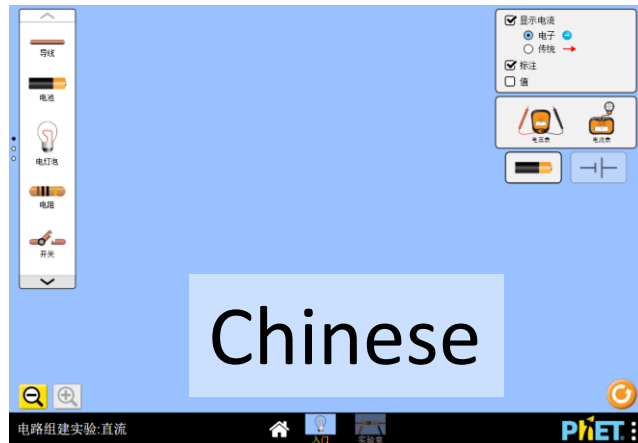

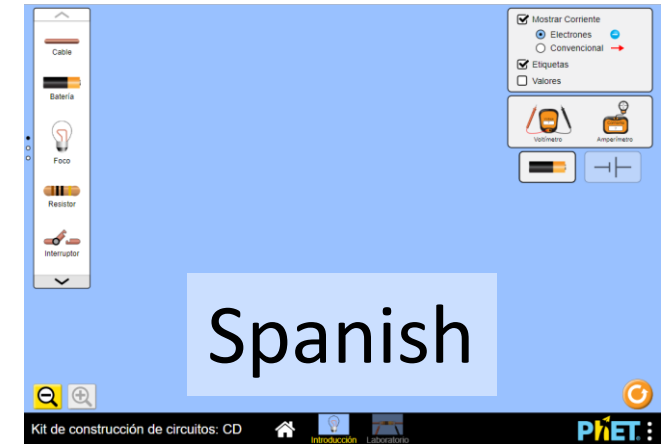

Software code:

Innovative HTML5 solution

Impact data:

60+ publications on design,
classroom use, and effectiveness

South African university students' attitudes towards chemistry learning in a virtually simulated learning environment†

Mafor Penn^{a*} and Umesh Ramnarain^{a,b}

This mixed method study investigated changes in 3rd year Bachelor of Education students' attitudes towards chemistry after learning interventions with virtual chemistry simulations. After participant students identified certain concepts from their 3rd year chemistry module as being abstract and not easily comprehensible, these concepts were facilitated during a 5 week learning intervention using PhET simulations as an alternative to traditional laboratory experimentation. In the first quantitative phase of the study, a 30-item pre-attitude test was administered to assess students' attitudes towards chemistry, followed by PhET chemistry simulation learning interventions. Thereafter, students wrote a post-attitude test. Findings of this phase revealed a significantly higher mean post-attitude test score, with students showing a positive attitude towards chemistry learning, post-intervention. The quantitative phase was followed by a qualitative phase which examined students' experiences on the use of simulations through semi-structured interviews. Findings from the qualitative phase revealed that students experienced autonomy and enjoyment during engagement with the simulations. They also perceived that their experiences in the virtually simulated environment improved their visualisation of chemistry concepts, thereby improving conceptual understanding. However, the students acknowledged that simulations cannot replicate the realism and authenticity associated with practical work in an actual laboratory. The implications of these findings are that virtual simulations provide a complementary learning tool capable of improving students' attitudes towards chemistry, and perceived by students to support their visualisation of abstract chemistry concepts. The findings of this study are particularly significant for chemistry learning at schools and universities in economically challenged countries such as South Africa where there is a shortage of well-equipped laboratories.

Introduction

Students' attitudes towards science and the learning of science is one of the fundamental goals of science teaching and learning (Hofstein and Mamlok-Naaman, 2011; Can and Boz, 2012). Hofstein and Mamlok-Naaman (2011) identify three key factors which can be considered to enhance students' attitudes and these include 'the methods used to present the content

nature of chemistry concepts, demand the incorporation of multiple tools in representing concepts, in order to enhance students' conceptual understandings. Many studies which have examined students' performance in chemistry have implicated abstraction, low imaginative power, poor concept representation and formation as some of the factors responsible for poor performance in chemistry both at high school and tertiary levels (Hofstein and Naaman, 2011; Ramnarain, 2015). These factors also

TEACHING WITH SIMULATIONS

Teachers use simulations for student motivation, content learning, and engagement in science practices.

ARGENTA PRICE, CARL WIEMAN, AND KATHERINE PERKINS

Interactive science simulations (sims) have become popular tools for science educators, and research confirms that sims can improve student learning (Rutten, van Joolingen, and van der Veen 2012). Over the past 15 years, the PhET Inter-

to get started. In this article, we turn to experienced teachers for guidance. We share responses from over 1,500 PhET-using high school teachers on how and why they use PhET sims (Perkins, Moore, and Chastain 2015), and we present ready-to-use

Future work to

INCREASE ACCESS TO AND IMPACT OF PhET'S POWERFUL STEM LEARNING TOOLS

- Fuel access and reach through the redesign and redevelopment of popular legacy sims into HTML5
- Integrate effective sim-based learning into curriculum and instruction, more broadly, worldwide
- Advance teacher professional development (at scale) for effective sim-based instruction

ADVANCE PHET-iO INNOVATION AND IMPACT

- Use PhET-iO's advanced capabilities and backend data to advance personalized-learning environments
- Use PhET-iO to advance embedded assessments and assess hard-to-measure attributes

BRING SIM-BASED INQUIRY TO MATH:

- Expand efforts to support algebraic thinking development in the grades 6-10
- Build a suite of 15 simulations for K-2 mathematics, focused on engaging and developing early number sense in all students

INCREASE ACCESSIBILITY FOR STUDENTS WITH LEARNING DIFFERENCES:

- Advance technology, pedagogy, and research for students with diverse learning differences
- Expand the suite of PhET simulations with accessibility features

600 MILLION SIMULATION RUNS (and growing)....
